INTRODUCTION

INSTRUCTOR: DR. LEONCIO RODRIGUEZ QUIÑONES

-FROM COLUMBIA

3 EXAMS (INCLUDING FINAL)

2 MIDTERMS (50%)

1 FINAL (25%)

QuizES (25%)

QUIZES ARE ON THURSDAYS

NO QUIZ THE FIRST WEEK

NO GRADING CURVES

2 LOWEST QUILES ARE DROPPED

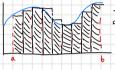

REVIEW:

CONTINUOUS = NO HOLES

DEFINITION OF DEFINITE INTEGRAL LET & BE A CONTINUOUS FUNCTION ON A CLOSED INTERVAL [A,B]. DIVIDE [A,B] INTO N

EQUAL PARTS OF WINTY

SUBDIVISION.

The definite integral of  $\frac{1}{2}$  from X=4 to X=6 is denoted by  $\int_a^b (x) dx \, ^7$  on Be defined as:

 $\int_{p}^{\pi} f(x) dx = \lim_{n \to 0} \sum_{i=1}^{j=1} f(x_i) \nabla^{x}$ 

MORE RECTANGLES : CLOSER APROX

WE CANNOT FIND INFINITE BUT WE CAN APPROXIMATE IT.

THE EVALUATION THEORY: LET f BE a cont. Function on [AQ] and let F BE and antiderivative of f then:  $f^b$   $\int_a^b f c d d x = F(b) - F(a)$ 

EXAMPLE S:

1) USE THE RIGHT ENDPOINT DEF OF DEFINITE INTEGRAL TO WRITE THE INTEGRAL SCALL AS THE UNIT OF A SUM

$$\begin{array}{c} \Omega_{X} = \frac{b-a}{h} \rightarrow \Omega_{X} = \frac{2-(c_{2})}{h} \rightarrow \Omega_{X} = \frac{4}{h} \\ \frac{1}{h}(x) = 2x + 2 \rightarrow \frac{1}{h}(x_{1}^{2}) \rightarrow 2x_{1}^{2} + 2 \\ X_{1} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{2} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{3} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{4} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i \Delta_{X} \rightarrow -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h} \\ X_{5} = -2 + i (\frac{\pi}{h}) \rightarrow -2 + \frac{4\pi}{h}$$

2) USE EMPLIATION THEORY OF FRENDOS EXAMPLE: 3) GEOMETRIC WAY: 
$$\int_{z_1}^{z_2} (\tau_{r+2}) dx = F(x) - F(z_1)$$

F=x2+2x

F(x)= 2x+2(x) = 8 F(x)=-2x+2(x)=0 8=0=8
